### Modbus functions (master)

As a master, the UMG511 supports the following modbus functions;

#### 01 Read Coil Status

Reads the ON/OFF status of discrete outputs (0X references, coils) in the slave. Broadcast is not supported.

#### 02 Read Input Status

Reads the ON/OFF status of discrete inputs (0X references) in the slave. Broadcast is not supported.

#### 03 Read Holding Registers

Reads the binary contents of holding registers (4X references) in the slave.

#### 04 Read Input Registers

Reads the binary contents of input registers (3X references) in the slave.

#### 05 Force Single Coil

Forces a single coil (0X references) to either ON or OFF. When broadcast, the function forces the same coil reference in all attached slaves.

#### 06 Preset Single Register

Presets a value into a single holding register (4X reference). When broadcast, the function presets the same register reference in all attached slaves.

#### 15 (0F Hex) Force Multiple Coils

Forces each coil (0X references) in a sequence of coils to either ON or OFF. When broadcast, the function forces the same coil reference in all attached slaves.

#### 16 (10Hex) Preset Multiple Registers

Presets values into a sequence of holding registers (4X references). When broadcast, the function presets the same register references in all attached slaves.

#### 23 (17Hex) Read/Write 4X Registers

Performs a combination of one read and one write operation in a single Modbus transaction. The function can write new contents to a group of 4XXXX registers, and then return the contents of another group of 4XXXX registers. Broadcast is not supported.

### Modbus Functions (Slave)

As a slave, the UMG511 supports the following modbus functions:

#### 03 Read Holding Registers

Reads the binary contents of holding registers (4X references) in the slave.

#### 04 Read Input Registers

Reads the binary contents of input registers (3X references) in the slave.

#### 06 Preset Single Register

Presets a value into a single holding register (4X reference). When broadcast, the function presets the same register reference in all attached slaves.

#### 16 (10Hex) Preset Multiple Registers

Presets values into a sequence of holding registers (4X references). When broadcast, the function presets the same register references in all attached slaves.

#### 23 (17Hex) Read/Write 4X Registers

Performs a combination of one read and one write operation in a single Modbus transaction. The function can write new contents to a group of 4XXXX registers, and then return the contents of another group of 4XXXX registers. Broadcast is not supported.

## Transfer parameters

The UMG511 supports the following transfer parameters:

Baud rate : 9600, 19200, 38400, 57600 and 11500 Baud  
 Data bits : 8  
 Parity : none  
 Stop bits (UMG511) : 2  
 Stop bits external : 1 or 2

## Byte sequence

The data in the modbus address list can be called up in the

- Big-Endian (high-Byte before low-Byte) and in the
- Little-Endian (low-byte before high-byte)

format.

The addresses described in this address list supply the data in the "Big-Endian" format.

If you require the data in the "Little-Endian" format, you must add the value 32768 to the address.

## Update rate

The modbus register addresses are updated every 200ms.

## Number formats

Type	Size	Minimum	Maximum
char	8 bit	0	255
byte	8 bit	-128	127
short	16 bit	$-2^{15}$	$2^{15} - 1$
int	32 bit	$-2^{31}$	$2^{31} - 1$
uint	32 bit	0	$2^{32} - 1$
long64	64 bit	$-2^{63}$	$2^{63} - 1$
float	32 bit	IEEE 754	IEEE 754
double	64 bit	IEEE 754	IEEE 754

## Explanations of the measured values

### Measured value

A measured value (in the UMG511) is an effective value which is formed over a period (measuring window) of 200ms.

A measuring window is 10 periods in the 50Hz network and 12 periods in the 60Hz network.

A measuring window has a start time and an end time.

The resolution between the start time and end time is approximately 2ns.

The accuracy of the start time and end time depends on the accuracy of the internal clock. (Typically +/- 1 minute/month)

In order to improve the accuracy of the internal clock, it is recommended that the clock in the device is compared with a time service and reset.

### Mean value of measured value

For each measured value, a sliding mean value is calculated over the selected averaging time.

The mean value is calculated every 200ms.

You can take the possible averaging times from the table.

n	Mean time / seconds
0	5
1	10
2	15
3	30
4	60
5	300
6	480
7	600
8	900

### Max. value of measured value

The *max. value of the measured value* is the largest measured value which has occurred since the last deletion.

### Min. value of measured value

The *min. value of the measured value* is the lowest measured value which has occurred since the last deletion.

### Max. value of mean value

The *max. value of the mean value* is the largest mean value which has occurred since the last deletion.

### Mains frequency power factor

The mains frequency power factor is the power factor of the mains frequency and is calculated using the fourier analysis (FFT). The voltage and current must not be sinusoidal.

### Distortion power factor

The distortion power factor is the power factor of all mains frequencies and is calculated using the fourier analysis (FFT).

### Mains frequency displacement power factor

Calculation of the power factor of mains frequency for displacement of the voltage by 90°.

This process requires a sinusoidal voltage and sinusoidal or non-sinusoidal currents.

Due to the fact that most network voltages are approximately sinusoidal, this simple calculation process provides a sufficient result in many cases.

### Power factor sign

Sign Q = +1 for phi in the range 0° .. 180° (inductive)

Sign Q = -1 for phi in the range 189° .. 360° (capacitive)

### CosPhi sign

- = for the supply of real power

+ = for obtaining real power

**Effective value of the current for phase conductor p**

$$I_p = \sqrt{\frac{1}{N} \sum_{k=0}^{N-1} i_{pk}^2}$$

**Effective value of neutral conductor current**

$$I_N = \sqrt{\frac{1}{N} \sum_{k=0}^{N-1} (i_{1k} + i_{2k} + i_{3k})^2}$$

**Effective voltage L-N**

$$U_{pN} = \sqrt{\frac{1}{N} \sum_{k=0}^{N-1} u_{pNk}^2}$$

**Effective voltage L-L**

$$U_{pg} = \sqrt{\frac{1}{N} \sum_{k=0}^{N-1} (u_{pNk} - u_{gNk})^2}$$

**Apparent power for phase conductor**

$$S_p = U_{pN} \cdot I_p$$

**Star connection voltage (vectorial)**

$$U_{\text{Stempunktspannung}} = U_{1ms} + U_{2ms} + U_{3ms}$$

**Real power for phase conductor**

$$P = \sqrt{\frac{1}{N} \sum_{k=0}^{N-1} (u(t_k) \cdot i(t_k))}$$

**Power factor for phase conductor**

$$Q = \sqrt{S^2 - P^2}$$

Sign Q = +1 for phi in the range 0° .. 180° (inductive)

Sign Q = -1 for phi in the range 189° .. 360° (capacitive)

**Total power factor (vectorial)**

$$Q_v = Q_1 + Q_2 + Q_3$$

**Total apparent power (vectorial) Sv**

$$S_v = \sqrt{P^2 + Q_v^2}$$

Unsigned

**Total apparent power (arithmetic) Sa**

$$S_{\text{Sum}} = S_1 + S_2 + S_3$$

Unsigned

## THD

THD (Total Harmonic Distortion) is the distortion factor and provides the relation of the harmonic parts of an oscillation to the mains frequency.

Distortion factor for the voltage

$$THD_U = \frac{1}{|U_{fund}|} \sqrt{\sum_{n=2}^M |U_{n.Harm}|^2}$$

Distortion factor for the current

$$THD_I = \frac{1}{|I_{fund}|} \sqrt{\sum_{n=2}^M |I_{n.Harm}|^2}$$

## ZHD

THD for the interharmonics.

## Ripple control signal U (EN61000-4-30)

The ripple control signal U is a voltage (200ms measured value) which is measured at a carrier frequency specified by the user. Only frequencies beneath 3kHz are observed.

## Ripple control signal I

The ripple control signal I is a current (200ms measured value) which is measured at a carrier frequency specified by the user. Only frequencies beneath 3kHz are observed.

## Positive sequence-negative sequence-zero sequence

The extent of a voltage or current imbalance in a three-phase system is identified using the positive sequence, negative sequence and zero sequence components.

The balance of the rotation current system strived for in normal operation is disturbed by the unsymmetrical loads, errors and equipment.

A three-phase system is called symmetric, when the three phase conductor voltages and currents are the same size and are displaced against each other by 120°. If one or both conditions are not fulfilled, the system is described as unsymmetrical. By calculating the symmetrical components consisting of the positive sequence, negative sequence and zero sequence, the simplified analysis of an imbalanced error is possible in a rotary current system.

Imbalance is a feature of the network quality for the limits specified in international norms (EN 50160 for example).

### Positive sequence

$$U_{Mit} = \frac{1}{3} \left| U_{L1,fund} + U_{L2,fund} \cdot e^{j\frac{2\pi}{3}} + U_{L3,fund} \cdot e^{j\frac{4\pi}{3}} \right|$$

### Negative sequence

$$U_{Geg} = \frac{1}{3} \left| U_{L1,fund} + U_{L2,fund} \cdot e^{-j\frac{2\pi}{3}} + U_{L3,fund} \cdot e^{-j\frac{4\pi}{3}} \right|$$

### Zero sequence

$$U_{Nullsystem} = \frac{1}{3} \left| U_{L1,fund} + U_{L2,fund} + U_{L3,fund} \right|$$

A zero component can only occur if a sum current can flow back through the main conductor.

### Voltage imbalance

$$U_{\text{unsymmetrie}} = \frac{U_{\text{Geg}}}{U_{\text{Mit}}}$$

### Peak value negative

Highest negative sampling value from the last 200ms measuring window.

### Peak value positive

Highest positive sampling value from the last 200ms measuring window.

### Under difference U (EN61000-4-30)

$$U_{\text{unter}} = \frac{U_{\text{din}} - \sqrt{\frac{\sum_{i=1}^n U_{\text{rms-unter},i}^2}{n}}}{U_{\text{din}}} [\%]$$

### Under difference I

$$U_{\text{unter}} = \frac{I_{\text{Nennstrom}} - \sqrt{\frac{\sum_{i=1}^n I_{\text{rms-unter},i}^2}{n}}}{I_{\text{Nennstrom}}} [\%]$$

### Crest factor

The crest factor describes the relation between the peak value and effective value of a periodic quantity. It serves as a characteristic value for general description of the curve form of a periodic quantity. The distortion factor is another example of a quantity for characterization of the difference from the pure sinusoidal form.

#### Example

A sinusoidal change voltage with an effective value of 230 V has a peak value of approx. 325 V. The crest factor is then  $325 \text{ V} / 230 \text{ V} = 1.414$ .

### K-factor

The K-factor describes the increase of the eddy current losses when loaded with harmonics. For a sinusoidal load on the transformer, the K-factor = 1. The larger the K-factor, the heavier a transformer can be loaded with harmonics without overheating.

$$K - \text{Faktor} = \frac{1}{I_R^2} \sum_{h=1}^{\infty} I_h^2 h^2$$

### Leistungsfaktor - Power Factor (vectorial)

According to DIN 40110, part 1 (May 1994), the power factor (displace factor) Lambda is calculated as follows:  
The P and S for the calculation of Lambda, not only contains the mains frequency part but also all harmonic parts.  
Due to the fact that the apparent power S is unsigned and only the sum is used by the real power, the power factor Lambda is unsigned.

$$PF_V = \frac{P}{S_V}$$

### Leistungsfaktor - Power Factor (arithmetic)

$$PF_A = \frac{P}{S_A}$$

### Fundamental Power Factor

Only the mains frequency part is used for calculation of the cosphi.

$$PF_1 = \cos \varphi = \frac{P_1}{S_1}$$

### Nominal current, voltage, frequency

The limit values for events and transients are set by the nominal value in percentage.

### Nominal current $I_{\text{rated}}$

The  $I_{\text{rated}}$  is the nominal current of the transformers and is required for calculation of the K-factor.
